

Remote Scan Module

Abledoc Remote Scan Module

The Abledoc Remote Scan Module provides users a simple method for scanning documents into the DocFinity or any other ECM system regardless of where they are located. The Scan Module can be used to connect to any twain scanner.

Remote and Intermittent Users

Not everyone has or needs a scanning department. The Abledoc Scan Module is designed to make the process of scanning and indexing documents into the companies shared archive simple, easy and affordable.

Now everyone can have a scanner and software on there desk capable of creating Searchable PDF's and sharing them with others in the organization.

Index Values

The Abledoc Scan Module can be configured to output an index file and are inserted into the database when the item is imported. These index values are made available as filters when searching the repository. Index values are also used for security and to drive a workflow process.

Connectivity

The Abledoc Scan Module can be configured to connect using FTP over the internet/intranet or a WAN network connection.

Online/Offline Mode

In the event a network connection is not available, the Scan Module will enter Offline mode and store the items locally. When the network is back online, the DropBox will move the cached items to the server. This allows a user to continue to work even if the network becomes unavailable.
