

OCR *for* AnyDoc™

The Single Software for All Your Forms, Invoices & Documents

The amount of information that arrives at your business is increasing everyday. And while a growing percentage of this information is Internet-based, the majority still comes in the form of paper documents.

It is the data on those paper documents that's vital to keep your business running. But the sheer volume of paper documents you receive, and manually process, makes for a crippling bottleneck that leads to waste, inefficiencies and inaccuracies - things your business can not afford.

For the variety of documents received by your organization every day - forms, invoices, faxes, inventory sheets, bills, sales forms, purchase orders, etc. - you need a single solution to automatically capture all the important data quickly, accurately and without the need for manual data entry. Regardless of whether you're processing 10,000 identical forms or 10,000 invoices, each from a different vendor, OCR for AnyDoc™ software is the solution for you.

OCR for AnyDoc quickly and easily extracts the information you specify from all your invoices, forms and documents. The process starts once the document is scanned (either locally or remotely). OCR for AnyDoc then utilizes industry leading recognition engines to capture all the data from your documents whether it's machine print, handprint, one- and two-dimensional bar codes or check boxes. OCR for AnyDoc excels in processing even the most complex documents. The software extracts data with up to 99.9% accuracy while eliminating the need for manual keying of information.

Captured data is automatically validated through a series of user-defined business rules to increase accuracy and minimize the need for manual verification. The software can be configured to

connect to your existing database for table lookups to compare and confirm valid data (for example, to ensure an invoice matches the price quoted on your internal purchase order).

Once the data is extracted, OCR for AnyDoc routes any "questionable" characters for verification or correction. You even have the option of defining critical data fields for mandatory verification to ensure 100% accuracy. Verification responsibilities can be done locally at your office or outsourced to off-site workers using OCR for AnyDoc's VERIFYit™.

In the final phase, OCR for AnyDoc creates an image of the document along with an ASCII file of the extracted data for use in your existing database or for long-term electronic storage and retrieval.

All of OCR for AnyDoc's functions are performed with minimal or no human supervision or intervention. AnyDoc Software's OCR for AnyDoc is installed at thousands of organizations worldwide and has helped businesses large and small double, triple and even quadruple their productivity while dramatically reducing their data entry costs. A Return on Investment is quickly realized in the first six to nine months.

Can you afford to wait?

- **Increase Data Accuracy**
- **Minimize Manual Data Entry**
- **Increase Efficiency**
- **Reduce Data Entry Costs**
- **Eliminate Manual Sorting**
- **Scalable Pricing**
- **Rapid Return on Investment**
